

## Case Study 3

# Multi Jurisdictional Compliance Validation

*Portfolio Case Study: Multi Jurisdictional Compliance Testing for Regulated iGaming Products*

## Case Study Summary

This case study demonstrates how I validate an iGaming product against different jurisdiction specific requirements before certification review. The focus is on confirming that game behaviour, player facing information, wager limits, transaction records, game history, responsible gaming controls and compliance evidence align with the rules of the target market.

In regulated iGaming, a product may pass in one jurisdiction but fail in another because each market can have different compliance expectations. My GLI experience includes end to end validation of iGaming systems across 15 plus international jurisdictions, ensuring alignment with regulatory and certification standards.

## Business Problem

An iGaming product cannot be treated as a one size fits all system. Different jurisdictions may have different requirements for game history, wager limits, player information, responsible gaming messages, recovery behaviour, transaction records and rule disclosures.

If a product is not tested against the correct jurisdictional requirements, it may be rejected during certification review or delayed before market entry.

## Business Risk

| Risk Area                 | Possible Impact                                           |
|---------------------------|-----------------------------------------------------------|
| Certification failure     | Product may not meet the target market requirements       |
| Market entry delay        | Operator may be unable to launch on time                  |
| Player protection risk    | Required responsible gaming controls may be missing       |
| Financial compliance risk | Wager limits or transaction records may be incorrect      |
| Reporting risk            | Required evidence may be incomplete or inconsistent       |
| Regulatory exposure       | Product may be escalated for correction or further review |
| Business cost             | Rework may increase development and testing effort        |

## Test Objective

The objective of this case study is to validate that the iGaming product behaves correctly under a selected jurisdictional configuration.

The testing confirms that:

| Validation Area             | Objective                                       |
|-----------------------------|-------------------------------------------------|
| Jurisdiction configuration  | Correct market configuration is applied         |
| Player balance display      | Balance is visible and accurate                 |
| Wager limits                | Minimum and maximum wager rules are enforced    |
| Game rules                  | Rules are accessible and complete               |
| Game history                | Round details are available and accurate        |
| Transaction records         | Wagers, wins and balances are traceable         |
| Responsible gaming messages | Required messages or controls display correctly |

|                |                                                            |
|----------------|------------------------------------------------------------|
| Error handling | Interrupted rounds recover according to expected behaviour |
| Localisation   | Required market text or currency displays correctly        |
| Evidence pack  | Test evidence supports certification review                |

## Test Scope

| In Scope                      | Description                                                              |
|-------------------------------|--------------------------------------------------------------------------|
| Jurisdiction setup            | Confirm that the product is configured for the correct market            |
| Game launch                   | Confirm that the game loads successfully under the selected jurisdiction |
| Player balance visibility     | Confirm that balance information is displayed correctly                  |
| Wager validation              | Confirm that allowed wager values are accepted                           |
| Wager restriction             | Confirm that invalid wager values are blocked                            |
| Game rules validation         | Confirm that rules and help screens are complete                         |
| Game history validation       | Confirm that wager, win, balance and round ID display correctly          |
| Transaction validation        | Confirm that financial values are recorded correctly                     |
| Responsible gaming validation | Confirm that required controls or messages display                       |
| Recovery testing              | Confirm that interrupted rounds recover correctly                        |
| Evidence capture              | Capture screenshots, test results and defect reports                     |

## Out of Scope

| Out of Scope Area               | Reason                                                               |
|---------------------------------|----------------------------------------------------------------------|
| Legal interpretation            | The tester validates against provided requirements, not legal advice |
| RNG certification               | Randomness testing is outside this case study                        |
| Full mathematical certification | This case study focuses on jurisdictional behaviour                  |
| Production data                 | All data is recreated and fictional                                  |
| Real client requirements        | No confidential jurisdictional or client documents are used          |

## Test Environment

| Item                       | Example Value                                             |
|----------------------------|-----------------------------------------------------------|
| Application type           | Demo iGaming slot game                                    |
| Test environment           | QA environment                                            |
| Jurisdiction configuration | Jurisdiction B                                            |
| Currency                   | ZAR                                                       |
| Player account             | Funded test player                                        |
| Starting balance           | R1 000.00                                                 |
| Browser                    | Chrome, Edge or Firefox                                   |
| Test management            | JIRA style defect tracking                                |
| Evidence                   | Screenshots, test cases, reconciliation tables and report |
| Database                   | MySQL or PostgreSQL                                       |

## Jurisdiction Requirement Summary

For this portfolio example, the fictional jurisdiction has the following requirements:

| Requirement ID | Requirement Description                                         |
|----------------|-----------------------------------------------------------------|
| JUR 001        | Player balance must be visible before and after each game round |
| JUR 002        | Minimum and maximum wager limits must be enforced               |
| JUR 003        | Game rules must be accessible from the game interface           |
| JUR 004        | Game history must show wager, win, balance and round ID         |
| JUR 005        | Interrupted game rounds must recover or resolve correctly       |
| JUR 006        | Responsible gaming message must display when required           |
| JUR 007        | Transaction records must be traceable in backend systems        |
| JUR 008        | Player facing information must match back office records        |

## Jurisdiction Matrix

| Requirement                | Jurisdiction A | Jurisdiction B | Jurisdiction C | Evidence Type        |
|----------------------------|----------------|----------------|----------------|----------------------|
| Display player balance     | Required       | Required       | Required       | Screenshot           |
| Display wager amount       | Required       | Required       | Required       | Screenshot           |
| Maximum wager limit        | Not required   | Required       | Required       | Test result          |
| Game history access        | Required       | Required       | Required       | History screenshot   |
| Responsible gaming message | Required       | Required       | Not required   | Screenshot           |
| Interrupted round recovery | Required       | Required       | Required       | Recovery evidence    |
| Rule screen availability   | Required       | Required       | Required       | Help screen evidence |
| Backend transaction trace  | Required       | Required       | Required       | SQL result           |

## Detailed Test Case

### Test Case ID

TC JUR 001

### Test Case Title

Verify that maximum wager limit is enforced for the selected jurisdiction

### Test Objective

To confirm that the game does not allow the player to place a wager above the maximum amount allowed for the selected jurisdiction.

### Preconditions

| Precondition                  | Description                                   |
|-------------------------------|-----------------------------------------------|
| Game is configured            | Jurisdiction B configuration is active        |
| Player account exists         | Valid funded test player account is available |
| Player balance is sufficient  | Player has enough funds to attempt the wager  |
| Wager rules are known         | Maximum allowed wager is R100.00              |
| Evidence capture is available | Screenshots can be captured                   |

### Test Data

| Field            | Value          |
|------------------|----------------|
| Player ID        | PLAYER2001     |
| Starting balance | R1 000.00      |
| Minimum wager    | R1.00          |
| Maximum wager    | R100.00        |
| Valid wager      | R100.00        |
| Invalid wager    | R101.00        |
| Jurisdiction     | Jurisdiction B |

### Test Steps

| Step | Action                                   | Expected Result                       |
|------|------------------------------------------|---------------------------------------|
| 1    | Login using a funded test player account | Player logs in successfully           |
| 2    | Launch the game under Jurisdiction B     | Game loads with correct configuration |
| 3    | Confirm player balance is visible        | Balance displays R1 000.00            |
| 4    | Set wager to R100.00                     | Wager is accepted                     |
| 5    | Start the game round                     | Game round starts successfully        |
| 6    | Return to wager selection                | Wager options are available           |
| 7    | Attempt to set wager to R101.00          | Wager is rejected or restricted       |

|    |                                   |                                         |
|----|-----------------------------------|-----------------------------------------|
| 8  | Check displayed message           | Clear restriction message is shown      |
| 9  | Check game history                | No invalid game round is created        |
| 10 | Check backend transaction records | No invalid wager transaction exists     |
| 11 | Capture evidence                  | Screenshots and records are saved       |
| 12 | Record test result                | Test passes if invalid wager is blocked |

## Expected Result

The game should accept a wager of R100.00 because it is within the allowed maximum. The game should reject or prevent a wager of R101.00 because it exceeds the jurisdictional limit.

No game round or backend transaction should be created for the invalid wager attempt.

## SQL Validation Example

```
SELECT
    player_id,
    round_id,
    wager_amount,
    transaction_status,
    jurisdiction_code,
    created_at
FROM game_transactions
WHERE player_id = 'PLAYER2001'
AND wager_amount > 100.00
AND jurisdiction_code = 'JUR_B';
```

## Expected SQL Result

| Result              |
|---------------------|
| No records returned |

## Jurisdiction Compliance Result Table

| Requirement ID | Requirement                              | Test Case  | Result | Evidence                  |
|----------------|------------------------------------------|------------|--------|---------------------------|
| JUR 001        | Balance visible before and after round   | TC JUR 001 | Pass   | Screenshot                |
| JUR 002        | Maximum wager limit enforced             | TC JUR 001 | Fail   | Screenshot and SQL result |
| JUR 003        | Game rules accessible                    | TC JUR 002 | Pass   | Help screen screenshot    |
| JUR 004        | Game history shows transaction details   | TC JUR 003 | Pass   | Game history screenshot   |
| JUR 005        | Interrupted rounds recover correctly     | TC JUR 004 | Pass   | Recovery evidence         |
| JUR 006        | Responsible gaming message displays      | TC JUR 005 | Pass   | Screenshot                |
| JUR 007        | Backend transaction is traceable         | TC JUR 006 | Pass   | SQL result                |
| JUR 008        | Player records match back office records | TC JUR 007 | Pass   | Reconciliation table      |

## Sample Defect Report

### Defect ID

DEF JUR 001

### Defect Title

Game allows wager above jurisdictional maximum limit

## Severity

Critical

## Priority

High

## Environment

QA Build 1.0.7

## Module

Wager Settings

## Jurisdiction

Jurisdiction B

## Related Test Case

TC JUR 001

## Description

The game allows the player to place a wager above the maximum amount allowed for the selected jurisdiction. The expected maximum wager is R100.00, but the player is able to place a R101.00 wager successfully.

## Steps to Reproduce

| Step | Action                                             |
|------|----------------------------------------------------|
| 1    | Login with a funded test player account            |
| 2    | Launch the game under Jurisdiction B               |
| 3    | Confirm that the player balance is visible         |
| 4    | Set the wager amount to R101.00                    |
| 5    | Start the game round                               |
| 6    | Check whether the wager is accepted                |
| 7    | Check game history and backend transaction records |

## Expected Result

The system should prevent the player from placing a wager above R100.00.

## Actual Result

The game accepts a R101.00 wager and creates a completed game round.

## Evidence

| Evidence           | Description                                     |
|--------------------|-------------------------------------------------|
| Screenshot 1       | Jurisdiction B configuration active             |
| Screenshot 2       | R101.00 wager selected                          |
| Screenshot 3       | Game round accepted                             |
| Screenshot 4       | Game history showing invalid wager              |
| SQL result         | Backend record showing wager amount above limit |
| Requirement matrix | JUR 002 marked as failed                        |

## Business Impact

The product may fail certification for the target jurisdiction because it does not enforce the required maximum wager limit. This may delay market entry and require a corrected build.

## Compliance Risk

This issue represents a jurisdiction specific compliance failure. A financial action that should be blocked is being accepted by the system, which may result in regulatory rejection.

## Recommendation

The wager validation logic should be updated to enforce the jurisdictional maximum limit. The fix should be retested by attempting wagers below, equal to and above the maximum amount. Backend transaction records should also be checked to confirm that invalid wagers are not created.

## Additional Jurisdiction Test Scenarios

| Test Case ID | Scenario                                                      | Expected Result                      |
|--------------|---------------------------------------------------------------|--------------------------------------|
| TC JUR 002   | Verify game rules are accessible                              | Help screen opens successfully       |
| TC JUR 003   | Verify game history includes wager, win, balance and round ID | Required details are displayed       |
| TC JUR 004   | Verify interrupted round recovery                             | Round resumes or resolves correctly  |
| TC JUR 005   | Verify responsible gaming message displays                    | Required message appears             |
| TC JUR 006   | Verify backend transaction traceability                       | Transaction can be found by round ID |
| TC JUR 007   | Verify player history matches back office record              | Records match across systems         |
| TC JUR 008   | Verify valid maximum wager is accepted                        | R100.00 wager is accepted            |
| TC JUR 009   | Verify invalid wager is rejected                              | R101.00 wager is blocked             |
| TC JUR 010   | Verify minimum wager is enforced                              | Wager below minimum is rejected      |

## Test Execution Summary

| Metric                        | Count |
|-------------------------------|-------|
| Total jurisdiction test cases | 10    |
| Passed                        | 8     |
| Failed                        | 1     |
| Blocked                       | 0     |
| Not run                       | 1     |
| Defects logged                | 1     |
| Critical defects              | 1     |
| High priority defects         | 1     |

## Final QA Recommendation

Based on the executed jurisdictional compliance scope, the product should not proceed to certification approval until the maximum wager defect has been corrected and retested.

The defect affects a jurisdiction specific financial control. Once the fix is implemented, the game should be retested using wagers below, equal to and above the maximum limit. The test evidence should confirm that invalid wagers are blocked at the user interface level and that no backend transaction is created.

## Skills Demonstrated

| Skill                | How It Was Demonstrated                                   |
|----------------------|-----------------------------------------------------------|
| Compliance testing   | Validated the product against jurisdiction specific rules |
| Functional testing   | Tested wager selection, game launch and game history      |
| Financial validation | Checked maximum wager enforcement                         |
| Backend validation   | Used SQL to confirm invalid transactions were not created |
| Risk analysis        | Explained certification and market entry impact           |
| Defect reporting     | Logged a clear critical defect with evidence              |
| Test documentation   | Created test cases, requirement matrix and summary report |
| Reconciliation       | Compared player facing and backend records                |

|                         |                                                 |
|-------------------------|-------------------------------------------------|
| Attention to detail     | Identified a market specific rule failure       |
| Certification readiness | Provided a clear recommendation before approval |

## Portfolio Disclaimer

All examples in this case study are recreated for portfolio purposes. No confidential employer, client, product, jurisdiction, system or regulatory information is included. The case study is based on real testing principles used in regulated iGaming environments, but all data, screenshots, identifiers and records are fictional.
